

## Notes for 18.2.1 (July 14–15, 2018) Release of METS Improvements

### Eligibility Improvements

Functional Area	Problem	Description of Change
Eligibility	If the primary person on a case had existing coverage that delayed the person's MinnesotaCare or insurance assistance (IA) start date, the nonprimary household members incorrectly had delayed start dates as well.	The start dates for nonprimary household members are correct regardless of whether the primary person's start date is delayed because of existing coverage.
Eligibility	When a worker removed a parent from a household's case, METS incorrectly set the remaining parent's Medical Assistance (MA) category to "Adult" rather than "Parent or Caretaker."	METS now correctly assigns the MA "Parent or Caretaker" basis of eligibility even if one parent leaves the household.
Eligibility	When a worker added benefit evidence for a person with IA and a worker later added an end date for that evidence, METS incorrectly removed the person's previous IA eligibility (from before the benefit evidence was added).	METS correctly leaves the previous eligibility in place in this situation.
Eligibility	When a worker added a comment to active evidence, METS incorrectly raised an item to verify.	METS no longer raises an item to verify in this situation.
Changes in Circumstances	After a worker changed a mailing or residential address, the old address in the person record did not have an end date.	When a worker changes an address, the end date for the old address appears in the person record.

## Application and User Interface Improvements

Functional Area	Problem	Description of Change
User Interface	METS did not list the Person Search results in alphabetical order by surname when a worker used a mix of upper- and lowercase letters in the search.	The Person Search results are now in alphabetical order regardless of whether a worker uses a mix of upper- and lowercase letters.
User Interface	A drop-down menu expanded only when the user clicked a very specific area of the menu, despite the cursor's turning into a pointer outside that area.	The working clickable area has been expanded to match the area in which a user's cursor turns into a pointer.
User Interface	The "Prospect Duplicate" watermark appeared in an outdated style.	The "Prospect Duplicate" watermark appears in the current style.
User Interface	Certain fields and pages had minor inconsistencies in borders, layout, and color.	Borders, layout, and color are consistent. On all pages, borders appear around text fields and drop-down boxes to make it easier to distinguish the values on the page. There are slight changes to some icons and to the color palette.
User Interface	The MA PDC home tab did not show the member details of an applicant who is eligible under the former foster care category of MA.	The MA PDC home tab shows the member details and coverage category for an applicant eligible under the former foster care category. It does not show the financial group, as it is not determined for former foster care youth.
User Interface	The application case (AC) number was not readable in the AC context panel because it overlapped the AC name.	The AC number no longer overlaps the AC name.
User Interface	When the primary applicant was female and her husband was also a tax filer, the benefit unit details for a tax dependent child were missing.	The benefit unit details for the dependent child are now shown in this situation.
User Interface	When evidence started and ended on the same date, METS showed only an end date.	When evidence starts and ends on the same date, METS now shows a span with both a start date and an end date.
Application	The summary page of the application did not allow users to collapse sections.	The summary page automatically shows fully expanded sections. Users can collapse each household member's sections to improve readability and can also expand the sections again.

Functional Area	Problem	Description of Change
Application	METS did not recalculate projected annual income (PAI) after an applicant or worker removed income from the final summary page.	<p>When a user removes income from the summary page and then clicks <b>Next</b>, a new PAI page appears with a new recalculated PAI amount based on the income change(s) made to the summary page.</p> <p>The user has the option to attest to the new recalculated amount or enter another amount. The user can exit the PAI information page by clicking <b>Back</b>, <b>Next</b>, or <b>Save &amp; Exit</b>.</p> <p>When the user clicks <b>Next</b>, a new static summary page appears. Information on this page cannot be directly changed, removed, or added. For the information on the new summary page to change, the user must make changes on one of the pages the information is drawn from (using the left menu or the <b>Back</b> button).</p>
Application	When a household member changed from an applicant to a nonapplicant during the application process, the Social Security number (SSN) initially entered remained on the household summary page. If the user tried to remove or change the SSN, the user got an error message and could not complete the application.	In this situation, if the nonapplicant's SSN is removed or changed, it does not remain on the household summary page, and the user is able to move past this page without issue.
Application	When a user clicked the <b>Change</b> link to edit the "Are you currently incarcerated?" information on the summary page, the user got an "Unhandled Server Exception" message.	When the user clicks the <b>Change</b> link, the incarceration page appears, as it should.
Application	If a user previously answered yes to the question about pending disposition of charges for incarceration and specified an expected release date, but then changed the answer to no, when the user navigated to the summary page, the <b>Expected Release Date</b> field was not cleared, as it should have been.	The summary page's <b>Expected Release Date</b> field is correctly cleared in this situation.

Functional Area	Problem	Description of Change
Application	When an applicant reapplied with new residential and mailing addresses that were the same, METS did not retain the new mailing address.	METS retains the new mailing address in this situation.
Application	When an applicant reapplied with a new mailing address, the new case often had multiple active mailing addresses.	In this situation, METS now correctly records an end date for the old mailing address and makes only the new mailing and residential addresses active.
